Kreg pocket hole jig setting for 2x4

14 July 2020 There is no doubt that Kreg Pocket-Hole Jig makes it easier than ever to build with wood. Joinery with pocket holes allows you to collect projects with screws instead of complex joints that require advanced skills and expensive tools. But if you think about it, the jig-jig with the holes is just part of the equation. The screw on the pocket hole is what holds your pieces together to create a strong, long-lasting joint. Here we break down the process of choosing a screw on several questions. Answer these and you will easily be able to choose the right screw for your project. Step 1. How thick is the wood you use? This is the most important thing you will want to know to choose the right screw. How to video shows why this matters so much. When you understand the thickness of the material, be sure to embark on the measurement. If that seems confusing, you're right. But it is necessary because most wooden products sold in home centers are cut into standardized sizes, such as 2x4, 1x6, etc. The problem is that these names are not the actual dimensions of the board. These are nominal dimensions that are larger than the actual dimensions. Always make sure that when choosing a Kreg Pocket-Hole Screw that you use the actual thickness. Once you know the actual thickness, just refer to the Jig owner's manual or on this handy graphic. You can also get a convenient for choosing a screw wheel to have an easy source of reference. The next question you need to ask yourself is: what kind of tree do you use to build your project? Soft, hard or plywood? When you know this, you can choose the right type of thread - rough or fine thread. Coarse thread for soft wood and leaf goods: pine, cedar, fir, spruce, poplar, Aspen, Baswood, Oil head, plywood, particle plates, MDF, Melamine coarse wood threads such as pine and spruce, e.g. soft conifers, are soft and not very dense. That is, they need a screw with deep, aggressive strands that will bite into these soft fibers. Coarse thread Kreg Hole screws work great for these trees. Coarse threaded screws are also a preferred choice for sheet goods such as plywood and MDF. Fine thread for hardwood: oak, maple, cherry, birch, ash, walnut, mahogany, Hickory Fine thread for hardwood On the other hand, hardwood such as oak, maple and cherry are too dense and hard for coarse screws. Aggressive strands tend to tear the wood fibers, which leads to cleavage in the tree. For these solid wooden arrays choose fine thread Kreg screws. The strands are less aggressive, but there are more of them to provide great retention power without splitting. Then think about where your project will be used. If you are building an indoor project, your project will not be subject to moisture. If you are building a project for outdoor living, though, you will want a screw that can withstand the severity of exposure to the elements. There is a Kreg for pocket holes for Case. Galvanized Kreg Pocket-Hole screws are the ones you will use for most projects. They are recommended for a wide variety of internal projects that will not be subject to significant amounts of moisture. Zinc coated screws are suitable for use in kitchens and bathrooms. Blue-Kote™ Kreg Pocket-Hole Screws are the best choice for wet or wet applications, including projects for the veranda, patio, private garage or outdoor areas. These screws feature 3 anti-corrosion layers to help them resist corrosion in long-distance wet areas. Stainless steel Kreg Pocket-Hole Screws are the best choice for external applications that include excessive exposure to moisture and corrosive elements. To. With all kinds of screws that you can buy in home centers, you may wonder if you really need to use Kreg Pocket-Hole Screws to build your projects. Why choose them on screws for wood, drywall screws or deck screws? The answer is that Kreg Pocket-Hole Screws are designed to touch pocket holes, with specific features that provide the best performance. Once you know who you need, make sure to stock up and keep a lot available for your next project Modular Wardrobe Organizer Six-Drawer Dresser Console This article represents my own opinion and may contain affiliate links. Please read my findings for more information. I use my Kreg-Mini Pocket Hole Jig quite often, but I always forget the settings for different wood thicknesses, so I made this small table to look up when I use my Kreg Mini. There are three measurements you need. Adjusting the depths of the collar, the distance from the edge and the size of the screw. First, you want to adjust the collar of the two-layer drill bit to control the depth of the pocket hole. Then you want to make sure that you tighten the Kreg-Mini at the appropriate distance from the edge of the material based on the thickness of the tree you join. Circuit board thickness Length CollarRele distance from endS4 length 1/23-5/161/4 over1 3/43-1/201/1 0 4 1- 1/24-1/41-1/4 Back2-1/2 The table above summarizes the adjustment of the depth of the collar, The distance from the edge and length of the screw for 1/2, 3/4 and 1-1/2 boards or plywood. PLEASE READ MY DISCLAIMER FOR MORE INFORMATION. If you are using Kreg Jig, this diagram will help you choose the right jig setting and screw length for your joint. You can also use the calculator I made to automatically generate the correct settings. Click here to buy Pocket Hole Jig SETTINGS POSTER for your store Click here to go to the calculator Settings Using Kreg Jig to join different thick boards Use the graph at the bottom of the chart to see who you jointly have, and follow the instructions to find the right box containing the correct jig setting and screw length. Adjust the jiggling setting of your jig and the depth collar of the drill bit of the Box. In the same box you will find the length of the screw. It works to connect any combination of wood thickness from 1/2 to 1-1/2. Be sure to test on-board combinations that you are not familiar with. It will also tell you what screw length works best for your wood thickness. Make sure that you have selected the correct type of joint. Always test an unknown screw and jig adjustment combinations before using your actual project. 1. Select Joint type 2. Select wood thickness part A Thickness part B thickness 3. Recommended Jig setting and screw length: Jig setting: 71-25-83-47-8111-811-413-911-2 Screw length: 7111-411-2221-2 A few months ago, I bought a KREG K4MS so I can build a Lego table as described on the companion buildsomething website that uses exclusively pocket hole construction. I have considerable experience with conventional...
